General description	This course contains basic and f	undamental concepts of resear	ch methods on biological	processes that are performed o
	living cells.			

	Study programme competences / results
Code	Study programme competences / results
A1	Define concepts, principles, theories and specialized facts of different areas of chemistry.
A3	Apply materials and biomolecules in innovative fields of industry and chemical engineering.
A4	Innovate in the methods of synthesis and chemical analysis related to the different areas of chemistry
B1	Possess knowledge and understanding to provide a basis or opportunity for originality in developing and / or applying ideas, often within a
	research context
B4	Students should be able to communicate their conclusions, and the knowledge and the reasons that support them to specialists and
	non-specialists in a clear and unambiguous manner
B5	Students must possess learning skills to allow them to continue studying in a way that will have to be largely self-directed or autonomous.
B7	Identify information from scientific literature by using appropriate channels and integrate such information to raise and contextualize a
	research topic
B10	Use of scientific terminology in English to explain the experimental results in the context of the chemical profession
B11	Apply correctly the new technologies to gather and organize the information to solve problems in the professional activity.

	Marked and a land and
	Methodologies
Methodologies	Description

Problem solving	Theoretical / practical class in which the teacher propose and students solve applications of theory, problems and applied
Ū	questions. It may also imclude the presentation by students of a topic related to the subject.
	Small group interactive classes seminars , " S " in the timetables)
Seminar	Tutorials in very small group ("T" in the timetables ) planned by the teacher and coordinated by the Tutoring
	Center. In general, each student will account for two hours per semester and subject. Monitoring activities as directed
	exercises, clarification of doubts about theory, problems, exercises, readings or other proposed tasks. Also the presentation,
	discussion or comments in small groups. Attendance at these classes is mandatory.
Mixed	Test to evaluate skills and knowledge
objective/subjective	
test	
Guest lecture /	Lesson taught by the teacher who may have different formats (theory, problems and / or general examples, general guidelines
keynote speech	on the matter ). The teacher may have the support of audiovisual and computer media but, in general, students do not need
	to handle them in class.

**Assessment comments** 

Evaluation procedure.

The assessment of this will be done through continuous assessment and the completion of a final exam. The access to the exam requires participation in at least 80% of classroom and teaching compulsory attendance activities (seminars and tutorials.

Continuous assessment (N1) will weigh 40% in the total of the course and consist of two components: interactive small group classes (seminars) and interactive classes in very small groups (tutorials). Seminars and tutorials may include exercises and assignments made in person, exercises submitted to the teacheror public presentations of topics previously selected.

The final exam (N2) will cover the entire content.

The student's score, will be obtained as a result of applying the following formula:

End = maximum Note (0.4 x 0.6 x N1 + N2, N2)

N1 is the corresponding to the continuous assessment (scale 0-10) and N2 numerical final exam (0-10 scale numerical grade.

Subjects that are recommended to be taken simultaneously

Subjects that continue the syllabus

Other comments

It is necessary to know the different kinds of biomolecules and processes of transfer of genetic information in cells. It is very important to attend the lectures.

It is essential to keep the study of matter " up to day".
