| General description | description Mechanics of Materials is the basis for the structural analysis and design of mechanical elements. The concepts of stress and strain are explained and discussed. Axial and shear stresses are dealt with as well as torsion and beams bending. | | | |

Methodologies Methodologies Description Guest lecture / Oral lecture supplemented with the use of audiovisual means, aiming at transmit knowledges and facilitate the learning within keynote speech the scope of structural analysis. Seminar Technique of work in group to resolve practical cases, by means of exhibition, discussion, participation and calculation. It employed calculator. Laboratory practice Methodology that allows the realization of activities of practical character, with computer, such as modelization, analysis and simulation of mechanical and estructural elements, as well as experimental studies in the workshop of structures, for estudying its deformation and resistance. Test writing used for the evaluation of the learning. Objective test
