General description	Integrated laboratory with specia	al emphasis on a	pplications of th	e main instrumental tech	niques.	
	The course explores the experim	nental methodolo	ogy of Physical 0	Chemistry and it is intend	ed to enable students to interpr	
	the experimental results from the theoretical models developed in the previous course of Physical Chemistry 3. The					
	development of critical thinking that allows integrating the theoretical experiment is a very important aspect in the overall					
	education of a chemist. Moreove	er, it introduces s	students to the m	anagement of the most	common instrumental technique	
	in any chemistry laboratory. (Eng	glish lecturers: T	eresa Vilariño/Je	osé Luis Barriada)

	Study programme competences / results
Code	Study programme competences / results
A1	Ability to use chemistry terminology, nomenclature, conventions and units
A5	Understanding of principles of thermodynamics and its applications in chemistry
A14	Ability to demonstrate knowledge and understanding of concepts, principles and theories in chemistry
A16	Ability to source, assess and apply technical bibliographical information and data relating to chemistry
A17	Ability to work safely in a chemistry laboratory (handling of materials, disposal of waste)
A18	Risk management in relation to use of chemical substances and laboratory procedures
A19	Ability to follow standard procedures and handle scientific equipment
A20	Ability to interpret data resulting from laboratory observation and measurement
A21	Understanding of qualitative and quantitative aspects of chemical problems
A22	Ability to plan, design and develop projects and experiments
B2	Effective problem solving
B3	Application of logical, critical, creative thinking
B4	Working independently on own initiative
B5	Teamwork and collaboration
C1	Ability to express oneself accurately in the official languages of Galicia (oral and in written)
C3	Ability to use basic information and communications technology (ICT) tools for professional purposes and learning throughout life

Learning outcomes			
Learning outcomes	Study	/ progra	mme

		results	
To acquire practical skills needed for experimental quantification of the thermodynamic and electrochemical properties of	A17	B2	C3
chemical systems.	A18	B3	
	A19		
	A22		
To acquire skills in the treatment of the measurements in the laboratory and skill in the use of software to carry out the	A20	B2	
analysis of experimental data.	A21	B3	
	A22		
To acquire practical skills in the application of instrumental techniques most commonly used in chemistry to the study of	A19	B2	
systems of physicochemical interest.	A22	B3	
To analyze and interpret the result of a chemical experiment from fundamental theoretical concepts of Physical Chemistry.	A5	B2	
	A14	B3	
	A20		
	A21		
	A22		
To write a comprehensive report of experimental work using appropriate scientific language.	A1	B3	C1
	A16	B4	C3
	A20		
To learn how to search, use and cite required bibliographic information.	A16	B4	C3
		B5	

	Contents
Торіс	Sub-topic

Chemical Thermodynamics practical demonstrations that do	1. Partial molal volumes of a binary mixture.
not require instrumental techniques	2. Molecular masses by cryoscopy measurements.
	3. Activity of an electrolyte by cryoscopy measurements.
	4. Molecular masses by distillation of mixture of two immiscible liquids.
	5. Phase diagram of a ternary system.
	6. Determination of the equilibrium constant.
	7. Determination of heat of solution for benzoic acid by solubility measurements.
	8. Partition coefficient. Application to the calculation of an equilibrium constant.
	9. Determination of the solubility of a compound sparingly soluble in several saline
	media. Common ion effect and salting effect.
	10. Chemical equilibrium. Determination of DG0, DH0 and DS0.
	11. Diagram of solid-liquid phase of a binary system.
Chemical Thermodynamics practical demonstrations that	12. Determination of the phase diagram of a vapor-liquid binary system.
incorporate instrumental techniques	13. Spectrophotometric determination of the equilibrium constant of an indicator.
	14. Characterization of a coordination compound by spectrophotometric
	measurements.
	15. Potentiometric determination of the dissociation product of water by Gran's
	method.
	16. Dye adsorption isotherms.

(*)The information in the planning table is for guidance only and does not take into account the heterogeneity of the students.

	Methodologies
Methodologies	Description
Seminar	Practical experiments to perform are proposed. These experiments are related to the theoretical contents of Physical
	Chemistry 3 subject. Different experimental methodologies are proposed and a specific experimental procedure is discussed.
Laboratory practice	Each student is assigned a certain number of practical experiments to be performed individually. The experiments will be
	indicated in advance in order to prepare both the theoretical background and experimental procedure before going into the lab.
	During the laboratory work, the student must show a responsible attitude in relation with both the safety regulations and the
	methodology and rigour of the scientific method.
	The experimental results of each experiment should be analyzed and discussed adequately, being neccesary the use of
	computer resources.
	Each student must hand in a written report of each of the experiments done. This report must contain all the experimental
	data, its analysis and the critical discussion of the results obtained. The report must be written following the guidelines of a
	scientific report.
Mixed	Assessment of all the contents worked on the subject, both the theoretical background and the experimental contents, related
objective/subjective	with the procedure, the analysis of data and the discussion of the results.
test	

	Personalized attention
Methodologies	Description
Laboratory practice	Solving any doubts individually and guiding the student in relation to course content.
	Part-time students and those with special academic leave permission could ask for presential or email tutorials when necessary.

		Assessment	
Methodologies	Competencies /	Competencies / Description	
	Results		
Laboratory practice	A1 A14 A16 A17 A18	The assessment of laboratory practices includes:	50
	A19 A20 A22 B3 B4	1) Continuous assessment of the work done by the student in the laboratory,	
	B5 C1 C3	considering the skills and knowledge achieved, the answers to the questions made	
		during the lab, as well as the experimental data, its analysis and discussion.	
		The lack of knowledge and/or attitude during the experimental work in the lab will be	
		reason for expulsion from the lab.	
		It is compulsory to complete the whole period of laboratory sessions to pass the	
		subject.	
		2) The report prepared for each one of the experiments carried out, which must	
		include all the experimental data, its analysis and the critical discussion of the results	
		obtained. In addition, the report must be written following the guidelines of a scientific	
		report.	
Mixed	A1 A5 A14 A20 A21	Written test to evaluate the contents of the subject, both the theoretical background of	50
objective/subjective	B2 B3 C3	the experiments and the analysis and discussion of the experimental results.	
est		It constitutes 50% of the final grade at the first opportunity, but students must obtain a	
		minimum of 3.5 points out of 10 in the written test to pass the course.	
		In the second opportunity, the written test will represent 100% of the final grade.	

Assessment comments

Attendance at all seminars and practices is compulsory for the student to pass the course.
First opportunity assessment:
The
student pass the subject when the average of the marks obtained in the different methodologies of assessment is equal to or greater than 5.0 points
out of 10 and the mark obtained in the written test is equal or greater than 3.5 points out of 10.
The student fail the subject in case of not achieving the minimum mark in the written test
(3.5), although the average of the assessment methodologies was equal to or
greater than 5.0. The subject appears as failed (4.5).
The final mark could be scaled up to a maximum of 0.5 points as a result of the evaluation of the overall student's progression.
A grade of NP ("absent") will only be given to the students who do not engage in any practice session in the lab.
Second opportunity assessement:
Students who do
not pass the continuous assessment of the practical work in the
laboratory must pass an experimental test at the lab.
The
students who pass the continuous assessment of the practical work in
the laboratory will have to pass a test in the classroom that will represent 100% of the final grade.
Students evaluated in the "second opportunity" will only be eligible for
Honors if the maximum number of licenses for the corresponding course
has not been fully covered in the "first opportunity"
Should it be more candidates to honors grade than licenses available, allocation of licenses could be done through a extraordinary exam.
The teaching-learning process, including assessment, refers to an
academic course and, therefore, will restart as new with every new
academic year, including all activities and assessment procedures
scheduled for that course.
Part-time students and students with special academic permission (according to the rules of the UDC):
Being an experimental subject, assistance to all activities is mandatory. As far as possible, it will be tried to fit the schedule of the practical sessions to
the availability of students

the availability of students.

The evaluation criteria for both the first and the second opportunity, will be the same as for the rest of the students.
