General description	The subject focuses on programming with dynamic and complex data structures, dealed from the perspective of abstract data types. It belongs to the block of subjects of Languages ??and Programming of the Basic Training Module of the degree. It has a strong relationship with the subjects of Programming I, Databases, Algorithms and Software Design. It is also somehow related with mathematical subjects, especially with the Discrete Mathematics subject. Regarding the professional profile, many areas of computing require the ability to work with the data structures studied in this subject that will allow students to improve their skills as programmers.			

Study programme competences	
Code	Study programme competences
A3	Capacidade para comprender e dominar os conceptos básicos de matemática discreta, lóxica, algorítmica e complexidade computacional e a súa aplicación para a resolución de problemas propios da enxeñaría.
A4	Coñecementos básicos sobre o uso e a programación dos ordenadores, sistemas operativos, bases de datos e programas informáticos con aplicación na enxeñaría.
B1	Capacidade de resolución de problemas
B3	Capacidade de análise e síntese
C3	Utilizar as ferramentas básicas das tecnoloxías da información e as comunicacións (TIC) necesarias para o exercicio da súa profesión e para a aprendizaxe ao longo da súa vida.
C6	Valorar criticamente o coñecemento, a tecnoloxía e a información dispoñible para resolver os problemas cos que deben enfrontarse.

Learning outcomes			
Learning outcomes	Study programme competences		
Understanding the mechanisms of dynamic memory management.	A4	B1	C6
Understanding the mechanisms of abstraction in the design of data structures.	A4	B1 B3	C3 C6
Building specifications, designing the abstract type from them, using appropriate data structures.	A3 A4	B1 B3	C3 C6
Using appropriate data structures and program algorithms to solve real problems.	A3 A4	B1 B3	C3 C6
Assuming the need for a good specification and a good design as steps prior to coding.	A4	B3	C6
Internalizing good programming practices.	A4	B3	

Contents	
Topic	Sub-topic
Dynamic Memory Management	Program memory organization. Definition of pointer variables. Dynamic memory allocation and deallocation. Pointer assignment and comparison operations.
Introduction to Abstract Data Types (ADT)	Abstraction in programming: Concept, Evolution of abstract data types in computer programming, ADT and Object Oriented Programming. Modularity in programming languages. Abstract Data Type (ADT): Definition and concept, Differences between datatype, data structure and ADT, construction of ADT, Advantages of data abstraction.
Lists	Informal specification of List ADT. Implementations of List ADT. Ordered list ADT: specification and implementations. Multilists and multiordered lists: concept, representations and usage.
Stacks	Informal specification of Stack ADT. Implementations of Stack ADT. Application on computer science.
Queues	Informal specification of Queue ADT. Implementations of Queue ADT. Queue variations. Priority queues. Application on computer science.
Trees	Tree definition and terminology. Binary Tree ADT: Informal specification, Implementation. Binary Tree traversals.
Binary Search Trees	Binary Search Trees. AVL Trees.

Planning				
Methodologies / tests	Competencies	Ordinary class hours	Student?s personal work hours	Total hours
Guest lecture / keynote speech	A3 A4 B1 B3	30	30	60
Problem solving	A3 B1 B3 C6	10	14	24
Laboratory practice	A4 B1 B3 C3 C6	20	26	46
Objective test	A3 A4 B1 B3	3	15	18
Personalized attention		2	0	2
(*)The information in the planning table is for guidance only and does not take into account the heterogeneity of the students.				

Methodologies	
Methodologies	**Description**
Guest lecture / keynote speech	Used for theory lectures. The teacher will make a brief description of the topics and objectives , in order to provide students with an overview of the subject. In addition they will establish relationships with other concepts previously acquired to build a timeline, and set out the recommended bibliography. They will then develop the theoretical contents.
Problem solving	In order to reinforce the theoretical concepts, practical cases will be presented, which initially will be resolved by the teacher to guide students. As the theoretical development advance, students will solve problems organized into working groups. When the examples used in the classes of problems or theoretical explanations involve coding or pseudocode, they will be developed showing the successive steps of top-down design. The reason is twofold: a) to get the student used to employ this method and b) to avoid being lost in the details of the particular syntax and language features, instead of paying attention to the understanding and design of the solution. Additional exercises will be assigned as extra-classroom activities. The student must solve them and comment/correct them with the teacher during group and/or individual tutoring . The purpose is to encourage the participation of students and promote, as far as possible, open dialogue and evaluation of solutions. After each topic, several self-assessment tests will be provided using virtual teaching resources, so that the students can verify their learning progress.
Laboratory practice	Practical classes require the students to program data structures in a high-level language. Regular delivery milestones will be proposed to encourage continued study. The practical project assignment will detail the nature of the problem to solve and its specifications, which must be strictly observed. Subsequently, the role of the teacher will be to oversee the practice sessions, solving doubts and correcting misunderstandings, bad programming habits and syntax errors, etc.
Objective test	Summative evaluation of the student through a final exam at the end of the semester, which will be very useful for demonstrating whether the student has acquired the skills of abstraction and design of ADTs and is sufficiently trained to use the precise skills to solve practical cases involving the application of such structures.

Personalized attention	
Methodologies	**Description**
Problem solving Laboratory practice Objective test	The development lectures, problem-solving sessions and practical sessions will be carried out taking into account the progress of the students. The general progress of the class will be combined with specific attention to give additional support or expand knowledge. Laboratory practices will be carried out, in part, as autonomous work. For its correct development, periodic monitoring will be necessary to allow students to clear up errors of concept as soon as possible and to ensure the quality of the work. In both cases, Moodle will be used to make available to the students "thematic forums" that resolve the general doubts detected related to specific activities such as the practices or proposed problems. Individual tutoring should not be used to extend the contents with new concepts, but to clarify the concepts already discussed in class. The teacher will use them as an interaction that allows him to draw conclusions about the degree of assimilation of the subject by students. Attention is maintained in the official tutoring hours through the following channels: - Email: Of use to make short answer queries. - Teams: virtual meetings preferably upon request via email.

Assessment			
Methodologies	**Competencies**	**Description**	**Qualification**

Problem solving	A3 B1 B3 C6	The results, form and conditions of completion of various scoring works that will be detailed during the course and that will be resolved during the REDUCED GROUPS TUTORIALS will be assessed. The result of the activity, as well as the discussion and active participation in class, will be valued in the final grade. This mark will only be added to the remaining marks once the course is passed.	10
Laboratory practice	A4 B1 B3 C3 C6	The practical work are mandatory according to the conditions in each problem assignment. There will be a periodic follow-up of the development of the practicals throughout the course that will influence their marks. Students must present all the practical assignments and obtain a global minimum of 4.5 out of 10 points to pass the subject. The work submitted must be original of the student. According to article 14, section 4, of existing regulations*, the delivery of non-original works or with duplicate parts (either by copies between colleagues or by obtaining it from any other sources ...) will carry a global mark of FAIL in the ANNUAL CALL, and therefore a failing grade FOR THE TWO OPPORTUNITIES, both for the group who employed copied material and for group that provided it.	40
Objective test	A3 A4 B1 B3	Mandatory completion. It implies a global treatment of the contents covered throughout the subject. It will be eminently practical so that students can demonstrate that they have acquired the necessary knowledge of abstraction and design, implementation and use of TADs and have trained enough in the skills required by the subject. It is necessary to obtain a minimum grade of 4.5 out of 10 to pass the subject.	60
Others			

Assessment comments

On attending
the practical classes.
Repeated
non-attendance could carry a penalty in the grade according to the specific
conditions that will be detailed at the beginning of the course.

On shared
responsibility for group work.
In the activities carried out in groups, such as practices,
all members of the group will be jointly liable for the work carried out and
delivered, as well as the consequences arising from non-compliance with the
rules of authorship of the same.

About the final
note of the minutes
.
In the event
that the conditions for the joint calculation of the mark between the final
test and the practicals are not met (that is, if either of the two is less than
4.5 out of 10), the minutes will include the minimum mark between 4.5 and the
one resulting from the joint calculation.
.
Those who does submit
all the compulsory practices or attends the objective test in the official
evaluation period will have the status of ?Presented?.

Second Chance Evaluation

The marks of the "Laboratory practices" as
well as the block of "Problem Solving" will be kept for the second
opportunity. Only lab practices qualified with FAIL or ABSENT in the first
opportunity may be delivered in the second, always according to the statement
that is proposed for it. In line with the UDC evaluation regulations, the
qualification derived from other activities developed throughout the course as
part of the continuous evaluation (introductory practicals, partial controls of lab practices, tests in
Small Tutoring Groups, etc.) will not be recoverable for the second opportunity.

Regarding the evaluation criteria, the second
opportunity will keep the same as the first.

Part-time
enrollment
In the case of students with part-time enrollment,
the obligation to attend practical classes is eliminated, however they will
have to deliver the assessable activities under the specific conditions and
deadlines that will be established during the course. It is the responsibility
of these students to inform the teacher of their circumstances.

Advanced
Opportunity in December

The evaluation of this opportunity will be based exclusively on a written test.
