General description	This subject is part of the Master	r's Degree in Mo	olecular, Cellular a	and Genetic Biology. Altl	hough due to its important	
	applications in research, health and industry, immunology would have to be treated as a subject with its own autonomy in					
	the Bachelor of Biology, the reality is that its close relationships with other biological disciplines, such as Cell Biology,					
	Biochemistry, Genetics and Microbiology led to the fact that it is often imparted in a not very homogeneous way, and					
	fragmented by diverse related areas. For this reason, this Master's course aims to offer the student basic, joint and updated					
	information on the components and response mechanisms of the immune system in physiological and pathological					
	situations. On the other hand, various basic techniques will be performed and interpreted which, we hope, will help you					
	address some problems throughout your research work.					
	, , ,	,				

	Study programme competences
Code	Study programme competences
A1	Skills of working in a sure way in the laboratories knowing operation handbooks and actions to avoid incidents of risk.
A2	Skills of using usual techniques and instruments in the cellular, biological and molecular research: that are able to use techniques and
	instruments as well as understanding potentials of their uses and applications.
A6	Skills of understanding the functioning of cells through the structural organization, biochemistry, gene expression and genetic variability.
A7	Skills of knowing and analyzing specific cellular systems as stem cells, nerve cells, cells of the immune system, or other cells related to
	several pathologies.
A8	Skills of having an integrated view of the previously acquired knowledge about Molecular and Cellular Biology and Genetics, with an
	interdisciplinary approach and experimental work.
В3	Skills of management of the information: that are able to gather and to understand relevant information and results, obtaining conclusions
	and to prepare reasoned reports on scientific and biotechnological questions
B4	Organization and work planning skills: that are able to manage the use of the time as well as available resources and to organize the work
	in the laboratory.
В6	Skills of team work: that are able to keep efficient interpersonal relationships in an interdisciplinary and international work context, with
	respect for the cultural diversity.

Learning outcomes	
Learning outcomes	Study programme
	competences

The student understand the basic types of immune responses triggered in front of the recognizing a pathogen or an antigen	AR14		
and the regulators and effectors mechanisms involved in each one of these responses.	AR14		
and the regulators and effectors mechanisms involved in each one of these responses.			
	AR14		
Learn the basic techniques and protocols and acquire the necessary skills required to handle, safely, the material used in the	AR1		
laboratory and to organize work in it. You will also learn to recognize the importance of their use in different contexts	AR2		
The student understand the basic types of immune responses triggered in front of the recognizing a pathogen or an antigen	AR6		
and the regulators and effectors mechanisms involved in each one of these responses.	AR7		
	AR8		
- At the end of the master, it is expected that students know the molecular, cellular, tissue and organic components of the	AR7		
immune system, and understand its integrated function in health and disease conditions.	AR8		
Collaborate in the performance of a work in small groups (2 people maximum) on some aspect of the contents of the matter		BR3	
theoretical program. You'll need to gather the right information, organize work, study the available resources to manage time.		BR4	
After processing, the work will be exposed orally by the authors, using computer tools and the appropriate terminology.		BR6	

Contents			
Topic	Sub-topic		
The theoretical course program	- Subtopics of the theoretical course program		
	- A brief history		
Topic 1. Introdución to the Immunology			
Topic 2. Components of the immune system.	- Immune System Cells: genesis and lineages. Primary and secondary lymphoid		
	organs: structure and function. Lymphocyte circulation: Cellular traffic and involved molecules.		
Topic 3. The innate immune system.	- Concept. Features. Physical, chemical and biological defense barriers. Cellular		
	components. Humoral components. Receptors of the innate immune system. Effectory		
	mechanisms of innate immunity. Phagocytosis and inflammation: phases, effector		
	cells and molecules involved. Interactions with the adaptive response.		
Topic 4. The adaptive / specific immune system	- Concept. Characteristics and properties (specificity, clonal nature, adaptability,		
	memory). Cellular components: B lymphocytes and T antigen presenting cells. Phases		
	of adaptive mechanism. Antigen recognition: T surface receptor (TCR) and B (BCR)		
	cells. Phase of cell activation and proliferation: Mechanism of clonal selection and		
	expansion. Phase of cell differentiation: Differentiation of T and B lymphocyte,.		
	Effectory phase. Immune mechanisms: cellular immunity. Humoral immunity.		
Topic 5. Antigens / immunogens / haptens.	- Antigen concept. Chemical nature. Properties. Immunogen concept. Epitope		
	concept: nature and types. Haptens and hapten-carrier conjugates. Types of antigens:		
	conformational and sequential, T dependent and independent. Multivalent,		
	Superantigens, Autoantigen and Mitogens		
Topic 6: Antibodies (immunoglobulins).	- Concept. Molecular structure: characters. Variable regions and antigen binding.		
	Constant regions and effectory function. Classification (classes, subclasses).		
	Expression of membrane and secreted immunoglobulins. Biological functions and		
	distribution of antibodies.		
Topic 7. antigen-antibody reactions	- The paratope structure. Complementarity between antigen and antibody.		
	Characteristics of the antigen-antibody binding: affinity, avidity and specificity.		
	Biological meaning: neutralization, opsonization, complement activation, cell		
	cytotoxicity antibody-dependent (ADCC)		
Topic 8. Citoquinas.	- Concept. General Properties. Mechanisms of biological action. Cytokine receptors:		
	types. Regulating effects of the cytokines. Functional classification: cytokines that		
	mediate immune responses		

	- Concept. Components. Nomenclature. Activation of the complement system:
Topic 9. The system of the complement	Alternative pathway. Classical pathway. Lectin pathway. Lytic pathway. Receptor
,	proteins of the complement. Regulation. Biological functions.
Topic 10. The molecules of Histocompatibility.	- Concept. Major histocompatibility complex (CPH / MHC). Histocompatibility genes: Properties. Structure of histocompatibility molecules: Class I and II. Binding peptide-MHC molecules: Characters. Polymorphism of the MHC molecules on their binding peptides. Expression of MHC molecules. Biological functions
Topic 11. The Processing and presentation of antigens.	- The antigen presenting cells: function. Recognition of peptide antigen. Antigen processing (degradation): endocytic (extracellular) and cytosolic (intracellular) pathways. Assembly of the peptides to MHC molecules. Presentation and expression of complex peptide-class I / II on the surface of the CPA.
Topic 12. Development, maturation, activation and	- Development and maturation in the bone marrow. Differentiation of B lymphocytes
differentiation of B lymphocytes	antigen independent: Expression of surface markers (CD19, 10). The functional antigen receptor (BCR). Maturation of B cells: mechanisms of negative and positive clonal selection. Production of virgin mature B lymphocytes. Migration to2nd lymphoid organs antigen-dependent: Activation of B lymphocyte by antigen. Structure and function of the BCR receptor. B cell proliferation through activation of T helper lymphocytes (CD4). Differentiation into plasma cells. B cell migration into primary follicles: Differentiation of B cells activated in memory B cells
Topic 13. Chap.13. Development, maturation, activation and differentiation of T lymphocytes	- Migration of T cell precursors to the thymus. Development and differentiation of T lymphocyte antigen-independent: Expression of surface markers (CD3, 4, 8). Maturation of T cells: mechanisms of positive and negative clonal selection. Production of virgin mature T cells. Migration to secondary lymphoid organs. Activation of mature T cells by antigen: TCR receptor: structure and function. Receptor interactions T cell / MHC-specific ligand: Activation of T lymphocytes proliferation of mature T lymphocytes. Differentiation into effector T lymphocytes. Subpopulations of effector T lymphocytes: cytotoxic T: CD8). T helper cells (Helper: CD4): Role of Th1 and Th2 subclasses. Production of T cell memory.
Topic 14. The immune response.	- Concept. Action mechanisms. Response types. Cellular Immune Response: characteristics of cellular cooperation. The influence of the antigen and of the microenvironment. The effector cells involved. Humoral immune response: Characteristics. Phases of activation, proliferation and differentiation of lymphocytes. Primary immune response. Immunological memory. Secondary immune response
Topic 15. Immune Tolerance.	- Concept of immune tolerance. General properties. Mechanisms of immunological tolerance. Central and peripheral tolerance of T and B cels. Mechanisms of induction of tolerance: Delección clonal, anergia clonal. Immunological ignorance. Supresors/regulatory T cells. Cell-cell interactions: help and suppression. Tolerance to the own and foreign antigens.
Program of practical classes	- Practices to develop in the (INIBIC) laboratory

Practice 1	- Protocol for the extraction of the distinct populations of blood cells in the peripheral
	blood.
	* Separation of leucocytes by gradient of density with Histopaque.
	* Obtaining of mononuclears cells of the peripheral blood (lymphocytes and
	monocytes).
	* Obtaining of granulocytes.
	* Obtaining of platelets.
Practice 2	- Flow Cytometry: antigénic determination of immune cells: Isolation of T lymphocytes
	by Sorter.
Practice 3	- ELISA (Essay by inmunoabsorción tied to enzymes: detection of specific antibodies
	or of soluble cytokines in serums).
Practice 4.	- Immunohistochemistry: Identification of antigenic markers on frozen or
	paraffin-embedded tissue by fluorescence techniques or enzyme samples.

	Methodologies
Methodologies	Description
Laboratory practice	- The student must realize 10 hours of practical class in the laboratory, compulsory and presentials, after the theoretical
	classes have finished. In the lab, they will develop different activities of experimental character (demonstrations, problems)
	that will allow to approach some aspects of the theoretical knowledge acquired in the magistral sesions. Besides, they will
	adquire the handle skills adapted for the development of simple experimental metho-dologies, own of the immnunological
	techniques. The practices class will be realized in the INIBIC, where they will have the suitable infrastructura to the aims of the
	practice, and also will take place the practical examination.
Objective test	
	- The student will realise a final examination on the theoretical contents of the subjet that can combine different types of
	questions: type test questions of multiple answer, short questions, of ordination, to complete, of association. Also is possible
	to construct it with one only type of these questions. The date and place of celebration of the final examination (Official
	Announcement of May) will warn with antelación. If the student suspended, or did not appear to the examination in May, he will
	have the possibility to present in the test of the month of July, whose date and place of celebracion will warn previously
Guest lecture /	- During the course the teacher will give between 14-15 master class sesions, attend them and compulsory, on some of the
keynote speech	corresponding contents to the program. In them will be explained the basic theoretical foundations of the subjet employing
	computer tools. For a better improvement, recommends that the student have read in advance the fundamental aspects of the
	topics mentioned in the recommended texts and also in the Moodle platform. The calendar and final schedule of the keynote
	sesions will communicate in advance in the web page of the subjet.

Seminar	-At the beginning of the course the teacher will suggest the accomplishment of a supervised study to the student in small
	groups (2 at most people) on some aspects of a topic of the theoretical immunology program. The student shall organize,
	prepare and discuss, along the course, under the teacher guide (3 tutorships max). The student will receive in advance the
	material object of the seminar, which will target towards current aspects of inmunology, in order to seek the needed
	information. The teacher will effect a pooling in common, in which they will discuss and resolve issues related to their contents
	and the conclusions they should reach all members of the group. The result of the study will be exposed by the authors to the
	rest gives class, during 1 hour, using computer tools.

	Personalized attention
Methodologies	Description
Guest lecture /	- The student can check your specific doubts during the keynote sessions and, more at wide, in the sharings of the seminars
keynote speech	Besides, it will have personal tutorials to solve any question related with the theoretical, practical and with the planned
Seminar	activities in the discipline matter. Given the purpose of this tutorial, we will try that the schedule be the most accommodated
Objective test	for the professor and the student, coordinating it previously between both.
Laboratory practice	
	Those students with part-time dedication or academic exemption, will only have to carry out the practical part of the subject in
	an indispensable way to be evaluated.

		Assessment	
Methodologies	Competencies	Description	Qualification
Guest lecture /	A6 A7 A8 B6	- The attendance to the masterclasses is fundamental for the domain of the contents	0
keynote speech		of the matter.	
		- The considered competitions are the following ones: A8, A9, A10, B1, B4, B5.	
Seminar	B3 B4 B6	- It will evaluate the work in group, considering also the attendance and participation	20
		in the various activities carried out during the preparation of the guided work, the	
		adecuación to the proposed topic, the ability of understanding and presentation and	
		the bibliography used. All this will represent 25% of the final qualification.	
		- The competences promoted in this activity are the following ones: A9, A11, B3, B4,	
		B5, B6, B9.	
Objective test	A6 A7 A8		60
		- At the end of the lectures will realise a final examination of the theoretical contents	
		of the course. The attendance to the theoretical classes and the participation in its	
		activities is compulsory, and will suppose 55% of the final qualification.	
		- With the objective proof, the student will show the level of knowledge and skills	
		purchased along the course, as well as the capacity of synthesis and abstraction	
		developed.	
Laboratory practice	A2 A1	- At the end of the practical classes, it will realise a final examination of the contents	20
		worked on them, in the own laboratory of the INIBIC. The attendance at the	
		(compulsory) practical classes and the participation in all activities is a key	
		requirement for his overcoming, and will suppose 20% of the final qualification of the	
		matter.	
		- The skills considered in this activity are the following ones: A3, A4, B4.	

Assessment comments

Attendance at theoretical and practical classes and the preparation and presentation of the supervised work is an essential condition & nbsp; to be evaluated both in the ordinary June call and in the July test. Attendance and participation in, at least, 80% of each of the face-to-face activities of the subject is necessary. - The evaluation of the subject will be based on a theoretical content exam, a practical content exam, and the student's participation in the preparation of directed work on some aspect of the theoretical program of the subject.

- In the May session there will be a final theoretical exam & nbsp; and in the INIBIC Laboratory the practical exam for the evaluation of learning will take place. All training activities will have a score between 0 and 10 points. To calculate the final grade the following criteria will be taken into account:
- 1. Assessment of theoretical learning. The mark obtained in this section will be 60% of the final mark.
- 2. Assessment of practical learning. The grade obtained in this section will be 20% of the final grade.
- 3. Evaluation of the student's participation in the preparation of the supervised work, of their attendance at the tutorials scheduled with the teacher for the resolution of doubts during its development and the result obtained in the final presentation of the same will mean 20% of the grade final.

 To pass the subject in the first call; the global sum of the aforementioned sections must be between 5 and 10 points, being necessary to obtain at least 4 points in each of the three sections. If this requirement is not met, the final grade would correspond to that of the section with the lowest value.

 Students who did not pass the subject in the May session, or did not attend it, will be able to try again in the July test. In this case, the evaluation will consist of:
- 1. In a written test on the contents & nbsp; subject theorists. The mark obtained in this section (between 0 and 10 points) will account for 80% of the final mark.
- 2. In a practical test of the same nature as the one mentioned above. The mark obtained in this section (between 0 and 10 points) will represent 20% of the final mark.

To pass the subject in the July call, the global sum of the aforementioned sections must be between 5 and 10 points, being necessary to obtain at least 4 points in each of the two sections. If this requirement is not met, the final grade would correspond to that of the section with the lowest value. The qualification of NOT PRESENTED, will be applied only in case the student had not participated in any activity of the subject (lectures, practical classes, supervised work and objective tests), or did not appear in the final call of July.

Students who request to be evaluated in the extraordinary call of December, both the theoretical contents as well as the evaluation criteria will correspond to the 2020-2021 academic year.

The fraudulent performance of the tests or evaluation activities will directly imply a failure grade "0" in the corresponding call, thus invalidating the grade obtained in all the evaluation activities of the extraordinary call.

Subjects that it is recommended to have taken before

Cellular Techniques/610441001

Molecular Techniques/610441002

Cell Signaling/610441004

Genetic Variation Mechanisms/610441005

Subjects that are recommended to be taken simultaneously

Molecular Microbiology /610441011

Human Genetics/610441017

Subjects that continue the syllabus

Stem Cells and Cell Therapy/610441010

Other comments

- Attendance and active participation in the different activities of the discipline.
- Read or work on the topic of the talks / tasks in advance and take the corresponding notes during their presentation.
- The study and periodic review of the subject, as it progresses, using the bibliographic material to understand and deepen the information received in the classes.
- The search for information in various sources for the preparation, presentation and defense of supervised work.
- The clarification of possible doubts in the tutorials with the teacher.

(*)The teaching guide is the document in which the URV publishes the information about all its courses. It is a public document and cannot be modified. Only in exceptional cases can it be revised by the competent agent or duly revised so that it is in line with current legislation.
