General description	This subject deals with quantifying	g substances in	n different types of	samples at trace levels	s. The most common
	methodologies will be presented, along with their usual problems, difficulties and limitations when applying them. Majo emphasis will be placed on how to plan and execute the different stages of the so-called ?analytical process?. Options				ns when applying them. Major
					analytical process?. Options to
	automate several working steps w	vill be discusse	d. Finally, some b	asic tools to treat the fir	nal data sets will be studied. This
	is termed chemometrics and it dea	als with experi	mental design and	optimization of an anal	ytical procedure, calibration and
	multivariate analyses of the data (including data mining).				

	Study programme competences
Code	Study programme competences
A14	Ability to demonstrate knowledge and understanding of concepts, principles and theories in chemistry
A15	Ability to recognise and analyse new problems and develop solution strategies
A16	Ability to source, assess and apply technical bibliographical information and data relating to chemistry
A17	Ability to work safely in a chemistry laboratory (handling of materials, disposal of waste)
A19	Ability to follow standard procedures and handle scientific equipment
A20	Ability to interpret data resulting from laboratory observation and measurement
A21	Understanding of qualitative and quantitative aspects of chemical problems
A22	Ability to plan, design and develop projects and experiments
A23	Critical standards of excellence in experimental technique and analysis
A26	Ability to follow standard laboratory procedures in relation to analysis and synthesis of organic and inorganic systems
B2	Effective problem solving
В3	Application of logical, critical, creative thinking
B4	Working independently on own initiative
B5	Teamwork and collaboration
C2	Oral and written proficiency in a foreign language
С3	Ability to use basic information and communications technology (ICT) tools for professional purposes and learning throughout life
C4	Self-development as an open, educated, critical, engaged, democratic, socially responsible citizen, equipped to analyse reality, diagnose
	problems, and formulate and implement informed solutions for the common good
C6	Ability to assess critically the knowledge, technology and information available for problem solving
C8	Understanding role of research, innovation and technology in socio-economic and cultural development

Learning outcomes	
Learning outcomes	Study programme
	competences

To know how to select the proper analytical methodology for each particular problem.	A15	В3	C4
	A16		C6
	A20		C8
	A22		
	A26		
To know how to plan and execute the different stages of the analytical procedure to quantify analytes at trace levels, including	A14	B2	C3
		B4	
the interpretation of the data.	A17	В4	
	A19		
	A20		
	A21		
	A23		
To know the main objectives of the most common chemometric techniques and to know their main application fields. To know	A14	B2	C2
how to extract relevant information from a multivariate study, in particular of a simplified environmental problem.	A15	B4	СЗ
	A16	B5	C4
	A20		C6
	A26		

	Contents
Topic	Sub-topic
Chapter 1: Introducing trace analysis	Importance of quantifying substances at trace levels. The analytical process when
	determining trace amounts: special requirements. Basic requisites and importance of
	sampling. Sources of errors when storing and treating samples. Quality assurance in
	trace analyses.
Chapter 2: Analyzing inorganic substances	Introduction. Decomposition and dissolution of inorganic matrices. Separation and
	preconcentration. Speciation of some relevant chemical elements. Examples of
	analytical applications.
Chapter 3: Analyzing organic substances	Introduction. Extraction methods for solid and liquid samples. Purification, fractionation
	and concentration of organic extracts. Examples of analytical applications.
Chapter 4: Automation in the analytical laboratory	Objectives of laboratory automation. Pros and cons. Classification of the automated
	analytical systems. Robotics. Miniaturization. Analysis of industrial processes.
Chapter 5: Introducing chemometrics	Defining chemometrics and its role in the analytical process. Concept of uncertainty
	and basic calculations.
Chapter 6: Statistical inference and univariate calibration	Most common inference statistical tests in laboratories. Analysis of Variance.
	Examples of applications in laboratories and industrial process control. Classical
	calibration by the least squares fit. Validation. Confidence intervals.
Chapter 7: Experimental design and optimization	Basic ideas of experimental design and optimization. Factorial designs, fractional
	factorial designs, Plackett-Burman designs, response surfaces. Sequential
	optimization by Simplex.
Chapter 8: Multivariate data analyses	Introduction. Classification of the most common pattern recognition methods.
	Unsupervised methods: principal components analysis, clustering. Supervised
	methods: SIMCA, k-nearest neighbours.
Laboratory	Pupils will apply the theoretical concepts studied throughout the theoretical lessons.
	Laboratory problems will deal with real problems in the environmental, industrial or
	foodstuff fields (among others) that pupils have to solve.

	Methodologies
Methodologies	Description
Laboratory practice	They will consist on the determination of some analytes at trace levels in samples gathered from real problems (environmental
	samples, foodstuff, clinic mixtures, etc.). The practices emulate a comprehensive problem: from sampling to sample treatment,
	separation of the analyte, measurement and data interpretation. The student must deliver a laboratory notebook.
	In addition to laboratory practices where analytical instrumentation will be handled by students, other practices will be carried
	out on computers to study the chemometric concepts (mainly, the multivariate data analyses techniques).
	At the end of the laboratory work the student will deliver a report of the work done with a critical and detailed analysis.
Seminar	They are intended to reinforce the understanding of several concepts given at the theoretical lessons. Numerical exercises will
Seminal	,
	be solved by the students. A comparison of the results generated in the laboratory practices will be made with other values
	gathered from other students. From the discussions, common sources of errors will be visualized. The student should perceive
	the difficulties inherent to the analyses of trace amounts of substances.
	Studies will be also made using computers to discuss a real multivariate dataset derived from environmental studies.
Workbook	Some specific, short readings will be proposed by the teacher. These will consist of reports where from the students will
	deliver a small report explaining some key ideas (e.g., a summary of the analytical strategy undertaken to solve the problem).
Guest lecture /	The teacher will develop and explain the basic contents of each chapter. Some documents will be delivered to the students
keynote speech	before the classes and they should have been reviewed before attending them. Audiovisual media will be employed
	throughout. Open dialogue will be empowered sometimes to solve doubts and improve the understanding of some basic
	issues.
Mixed	Written test to be held in the official call on January / July, in which the degree of learning and the acquisition of skills by the
objective/subjective	student is evaluated.
test	It will consist of theoretical questions and applied questions, problem solving and practical content. The completion date is
	indicated on the examination timetable grade.

Personalized attention			
Methodologies	Description		
Workbook	Close supervision here means that the teacher will monitor as close as possible the activities of the student. The personal		
Seminar	work of the student will be required and tested. The teacher may recommend further readings, clarify wrong statements,		
Laboratory practice	recommend literature searches, etc.		
	Students being recognized officially as partial-time and entitled not to attend the lectures will be attended in a tutorships regime (set hour with teacher in advance).		

Assessment			
Methodologies	Competencies	Description	Qualification

Workbook	C4 C6 C8	The report delivered by the student will be examined. In particular, identification and justification of the analytical strategies presented into the work.	5
Seminar	A15 A16 A20 A21 B2 B3 B4 C3	Active participation of the students will be scored, as well as the correct answers to questions or numerical calculations.	10
Laboratory practice	A15 A16 A17 A19 A20 A21 A22 A23 A26 B3 B4 B5	They will be scored on a on-going basis (order into the laboratory, correctness of the calculations, good manual operations, report delivered on-time, etc.).	15
Mixed objective/subjective test	A14 A15 C2	The exam will consist of tests (with a unique true response), short questions and numerical exercises. They will be related to the theoretical aspects of the subject. Some questions on these practices will be included in the objective test.	70

Assessment comments

Students will be evaluated in a continuous way according to their

attendance to the scheduled activities, their engagement in the seminars, their

discussions on the questions and numerical calculations, summary of workbook,

the laboratory practices and the mixed test.

Laboratory

practices are mandatory, otherwise the subject will not be aproved.

The

mixed test will consist of two parts: theoretical questions and exercises, each

part must be passed. In case of surpass any part at the first opportunity, it will NOT be retained at the second opportunity.

FIRST

OPPORTUNITY

To pass the subject it is required to get, at least, 5 points (out of 10) in the Objective test (exam) and, for each and every other activity, at least, 4 points (out of 10), so that the weighted sum reaches -at least-5 points (out of 10). The subject will not be passed in case the weighted sum reaches 5 points but the score of an activity does not reach 4 points. In this case, the final score of the subject will be fail (4.5 points). Students will be qualified as "Not presented" whenever they do not perform neither the laboratory practices nor the mixed test.

SECOND

OPPORTUNITY

Fort he "second opportunity" should be understood as a second opportunity for the mixed test (exam). All the original scores associated to practices, seminars, readings, etc. will be maintained, only the score of the exam made in second opportunity will substitute that of the first opportunity. To pass the subject in the second opportunity a minimum score of 5 points (out of 10) in the exam must be obtained, so that the weighted sum of all scores reaches (at least) 5 points (out of 10).

PARTIAL-TIME AND/OR EXEMPTED FROM REGULAR ATTENDANCE TO THE LESSONS

Students being recognized officially as partial-time and/or exempted from regular attendance to the lessons, will be evaluated only according to their scores on the objective tests (80%), workbook (5%) and the laboratory practices (15%). For them, the laboratory practices will be scheduled as flexible as possible, although taking into account the regular timetables, as well as the instrumental and human resources available. This holds for both evaluation opportunities.

NEXT COURSES

For next courses no score will be maintained and all activities will have to be repeated.

Recommendations

Subjects that it is recommended to have taken before

Analytical Chemistry 1/610G01011

Analytical Chemistry 2/610G01012

Instrumental Analytical Chemistry 1/610G01013

Instrumental Analytical Chemistry 2/610G01014

Subjects that are recommended to be taken simultaneously

Environment and Quality/610G01037

Subjects that continue the syllabus

Final Dissertation/610G01043

Other comments

To keep the

subject updated is highly recommended. This includes reviewing the theoretical lessons after the classes, solving the numerical exercises, studying the practical classes, etc. Students should take advantage of seminars, supervision activities, etc. to solve their doubts. They should try to generate a sense of ?analytical criterion? to solve a problem; from sampling to data treatment.Students will need knowledge of the analytical techniques studied in previous academic courses (gravimetry, titration, spectrometry, chromatography, electrochemistry, etc.)A minimum knowledge of informatics is needed (word processors, spreadsheets, searches

throughout internet, etc.).

(*)The teaching guide is the document in which the URV publishes the information about all its courses. It is a public document and cannot be modified. Only in exceptional cases can it be revised by the competent agent or duly revised so that it is in line with current legislation.
