General description	Physical Chemistry consists in the	study of funda	amental physical p	rinciples that govern the	e properties and behavior of	
	chemical systems. A chemical systematical sy	em can be st	udied from a micro	scopic or a macroscopi	c point of view. In this course of	
	Physical Chemistry the methodology to study the macroscopic equilibrium is introduced (Chemical Thermodynamics)					
	The subjects taught in this course are the essential theoretical foundations for the subsequent subjects in Physical					
	Chemistry. They are also a framew	ork for all oth	er branches of che	mistry that necessarily	apply many of the concepts	
	studied in this course in the development of their specific programs.					

	Study programme competences
Code	Study programme competences
A1	Ability to use chemistry terminology, nomenclature, conventions and units
А3	Knowledge of characteristics of the different states of matter and theories used to describe them
A5	Understanding of principles of thermodynamics and its applications in chemistry
A14	Ability to demonstrate knowledge and understanding of concepts, principles and theories in chemistry
A15	Ability to recognise and analyse new problems and develop solution strategies
A16	Ability to source, assess and apply technical bibliographical information and data relating to chemistry
A21	Understanding of qualitative and quantitative aspects of chemical problems
B2	Effective problem solving
В3	Application of logical, critical, creative thinking
C3	Ability to use basic information and communications technology (ICT) tools for professional purposes and learning throughout life

Learning outcomes			
Learning outcomes	Study	/ progra	amme
	cor	npeten	ces
To know the principles of thermodynamics and their applications in chemistry	A1	B2	C3
	А3	В3	
	A5		
	A14		
	A15		
	A16		
	A21		
To solve complex problems through the use of spreadsheets.	A1	B2	C3
	A14	В3	
	A15		
	A16		
	A21		

To adquire skills in literature search of real and research applications about the subject contents of the course	A14	В3	C3
	A15		
	A16		
	A21		

Topic 1. Introduction to Chemical Thermodynamics. 2. The principles of Thermodynamics. 2. The principles of Thermodynamics. 3. Thermodynamic potentials and evolution of systems Equilibrium conditions in closed systems: the Gibbs and Helmholtz functions. Thermodynamic relationships for a closed system. Applications: thermodynamic equations of state, the difference between the heat capacities, the Joule-Thoms coefficient. 4. Thermodynamics standard reaction functions Standard enthalpy: Kirchhoff's and Hess's law. Standard Entropy: the third law thermodynamics, conventional entropy determination. Standard Gibbs energy. It thermodynamics of systems of variable composition The chemical potential. Partial molar properties. Material equilibrium conditions equilibrium and chemical equilibrium. 6. Gas state thermodynamics The ideal gas: chemical potential and properties, ideal gas mixture. Real gases equation of state and fugacity, fugacity calculation.
2. The principles of Thermodynamics. First law: internal energy, enthalpy, heat capacities. Second law: entropy, calculate entropy change in simple systems. 3. Thermodynamic potentials and evolution of systems Equilibrium conditions in closed systems: the Gibbs and Helmholtz functions. Thermodynamic relationships for a closed system. Applications: thermodynamic equations of state, the difference between the heat capacities, the Joule-Thoms coefficient. 4. Thermodynamics standard reaction functions Standard enthalpy: Kirchhoff's and Hess's law. Standard Entropy: the third law thermodynamics, conventional entropy determination. Standard Gibbs energy. Intermodynamics of systems of variable composition The chemical potential. Partial molar properties. Material equilibrium conditions equilibrium and chemical equilibrium. 6. Gas state thermodynamics The ideal gas: chemical potential and properties, ideal gas mixture. Real gases
the entropy change in simple systems. 3. Thermodynamic potentials and evolution of systems Equilibrium conditions in closed systems: the Gibbs and Helmholtz functions. thermodynamics, conventional entropy determination. Standard Gibbs energy. In thermodynamics of systems of variable composition The chemical potential. Partial molar properties. Material equilibrium conditions equilibrium and chemical equilibrium. The ideal gas: chemical potential and properties, ideal gas mixture. Real gases
thermodynamic tables. 5. Thermodynamics of systems of variable composition The chemical potential. Partial molar properties. Material equilibrium conditions equilibrium and chemical equilibrium. 6. Gas state thermodynamics The ideal gas: chemical potential and properties, ideal gas mixture. Real gases
5. Thermodynamics of systems of variable composition The chemical potential. Partial molar properties. Material equilibrium conditions equilibrium and chemical equilibrium. 6. Gas state thermodynamics The ideal gas: chemical potential and properties, ideal gas mixture. Real gases
equilibrium and chemical equilibrium. 6. Gas state thermodynamics The ideal gas: chemical potential and properties, ideal gas mixture. Real gases
6. Gas state thermodynamics The ideal gas: chemical potential and properties, ideal gas mixture. Real gases
equation of state and fugacity, fugacity calculation.
7. Phase equilibria in systems of one component The phase rule. Phase diagram for one-component systems. Clapeyron and
Clausius-Clapeyron equations. Classification of phase transitions.
8. Solutions Ideal solution: Raoult's Law. Ideally dilute solution: Henry's Law. Mixing function
Nonideal solutions of nonelectrolytes: activity and activity coefficients, the
Gibbs-Duhem equation, excess functions. Solutions of electrolytes: the activity
coefficient of ionic species.
9. Phase equilibria in multicomponent systems Liquid-vapor equilibrium: ideal solution at constant T and P constant, fractional
distillation, azeotropic mixtures. Liquid-liquid equilibrium: miscibility. Solid-liquid
equilibrium: temperature-composition diagrams, simple eutectic, compound form
with congruent and incongruent melting, thermal analysis. Solution-crystalline s
equilibrium. Colligative properties: freezing point depression, boiling point eleva
osmotic pressure, vapor-pressure lowering. Nernst's distribution law.
10. Chemical equilibrium in gas mixtures: the equilibrium constant, changes in chemical equilibrium in gas mixtures: the equilibrium constant, changes in chemical equilibrium in gas mixtures: the equilibrium constant, changes in chemical equilibrium in gas mixtures: the equilibrium constant, changes in chemical equilibrium in gas mixtures: the equilibrium constant, changes in chemical equilibrium in gas mixtures: the equilibrium constant, changes in chemical equilibrium in gas mixtures: the equilibrium constant, changes in chemical equilibrium constant changes in chemical equilibrium constant changes in chemical equilibrium constant changes in chemical equilibrium changes in chemical equ
equilibrium-Le Chatelier's principle. Chemical equilibrium in solution. Chemical
equilibrium with pure solids and liquids.
11. Surface thermodynamics The interface: surface tension. Curved interfaces: capillary rise. Adsorption on s
physisorption and chemisorption, adsorption isotherms.
12. Electrochemical equilibrium Electrochemical systems. Thermodynamics of electrochemical systems: the
electrochemical potential. Galvanic and electrolytic cells. Nernst equation and
standard electrode potentials. Types of reversible electrodes. Liquid junction
potentials. Determination of thermodynamic parameters.

Planning

(*)The information in the planning table is for guidance only and does not take into account the heterogeneity of the students.				

	Methodologies
Methodologies	Description
Guest lecture /	Lectures, where the theoretical concepts will be introduced
keynote speech	
Problem solving	Seminars in small groups where it will be shown the application of the theoretical contents from the lectures into problem
	solving
ICT practicals	Practical exercises where students will solve complex problems using computer programs
Critical	Students will be taught to do bibliographic search. They will be asked to perform searches about topics related with the
bibliographical	subject.
	Reading of papers related with topics from the subject will be also proposed
Mixed	Students will be asked to solve a collection of problems which combines the theoretical concepts and their application.
objective/subjective	
test	
Speaking test	Students will attent to two individual tutorial sesions where they will present test questions developed by themselves about the
	theoretical concepts of the course. Those questions will be discussed with the lecturer.
Mixed	A final test will be done at the end of the semester. Students will be asked solving problems on their own
objective/subjective	

Personalized attention			
Methodologies	Description		
ICT practicals	These works are proposed in the class and students must solve them supported by individual tutorials with the teacher.		
Critical			
bibliographical	Part-time students and those with special academic leave permission will have access to the materials of the subject in the		
Problem solving	moodle application. They could ask for presential or email tutorials when necessary while they prepare for the final test.		
Speaking test			

test

	Assessment			
Methodologies	Competencies	Description	Qualification	
Mixed	A1 A3 A5 A14 A15	Final examination of the contents of the subject based on the autonomous, individual	100	
objective/subjective	A21 B2 B3	resolution of problems.		
test		Those students that pass the first partial exam will need to be evaluated of the second		
		part of the subject in the final test. It is required to obtain 5 out of 10 to successfully		
		pass the exam.		
		Students that fail in the first partial exam will be evaluated for the whole contents of		
		the subject. It is also required to obtain 5 out of 10 to successfully pass the exam.		
		Marks obtained in both exams constitute the 100% of the final qualification.		

Mixed	A1 A3 A5 A14 A21 B2	It will be assessed the individual contribution to the resolution of all activities. This test	0
objective/subjective	В3	constitutes a partial exam of the matter. It is required to obtain 5 out of 10 to	
test		successifully pass the exam.	

Assessment comments

The student who engages in any of the two tests will be considered to have attended on the subject at the time of the final mark. The qualifications obtained will correspond to January (first opportunity).

Exceptionally, the rating of both opportunities will be made with the final test, scoring 10 out of 10, for those student at part time or with special academic leave permission.

The rating of the second opportunity will be made only with a final test, scoring 10 out of 10.

Honors grade: priority is given in the first opportunity. Honors grade may only be granted in the second opportunity if their number have not be exhausted in the first opportunity final qualifications. Should it be more candidates to honors grade than honors available, allocation will be done through a extraordinary exam.
