General description	This course on Algorithms allows the computer science engineering student to delve into algorithm design techniques,					
	taking into account qualitative and quantitative factors in their evaluation. On the one hand, it completes the training on the					
	writing of efficient and correctly s	tructured progr	ams. On the oth	er hand, it approaches the	e most common problem-solving	
	techniques that an engineer can	find.				
	It is worth noting that the conduction of experiments involving runtime measurements on different algorithms provides an empirical approach that is usually highly regarded by the student, who can thus establish the concrete interpretation of the complexities found. The difficulties that arise in some of the studied cases allow for a complementary reflection on aspects like computing resource management, process execution details, architectures and operating systems used, etc.					
	The study and analysis of an important set of fundamental algorithms is also worth remarking, covering a large range of algorithmic techniques and their applications. The possibility of using different techniques for the resolution of some problems results naturally into thinking about the advantages and disadvantages of the different strategies, and the need to know how to choose the best alternative for each particular scenario.					
	Lastly, it is important to develop the necessary rigor to develop solutions that not only adapt to a given specification, but also do so in an efficient way from the viewpoint of the needed computational resources. This will be illustrated by means o various practical cases where the existence of known efficient algorithms leads us to reject alternative designs, even when they look very natural at a first glance.					

Contingency plan	1. Modifications to the contents
	No changes.
	2. Methodologies
	*Teaching methodologies that are maintained
	Tutored works
	*Teaching methodologies that are modified
	Lecture: It will be done remotely, through Teams and/or recorded videos.
	Short answer test: It will be done remotely, through Teams and Moodle.
	Laboratory practicals: They will be carried out remotely, using Teams. A laptop configuration with linux, gcc and svn is
	recommended.
	Problem solving: It will be done remotely, using Teams and Moodle.
	Objective test: It will be done remotely, using Teams and Moodle, in addition to the recommended configuration of the
	laptop with linux, gcc and svn for the practical part.
	3. Mechanisms for personalized attention to students
	Email: daily, for inquiries.
	Moodle: daily, to access class materials, check the calendar or use the forums.
	Teams: during the theory, SGT or practical hours foreseen in the course schedule; group tutorials on the theory (2h per
	week) and on the practicals (2h per week); regarding individual tutoring, it will be maintained during each teacher's office
	hours upon request via email.
	4. Modifications in the evaluation
	All tests (continuous assessment and objective test) are made remotely.
	*Evaluation observations:
	The provisions of the teaching guide are maintained.
	An alternative date will be offered to students who have logistical problems at the time of the tests.
	5. Modifications to the bibliography or webgraphy
	No changes.

	Study programme competences / results
Code	Study programme competences / results
A12	Coñecemento e aplicación dos procedementos algorítmicos básicos das tecnoloxías informáticas para deseñar solucións a problemas,
	analizando a idoneidade e a complexidade dos algoritmos propostos.
A13	Coñecemento, deseño e utilización de forma eficiente dos tipos e estruturas de datos máis adecuados á resolución dun problema.
B3	Capacidade de análise e síntese
C3	Utilizar as ferramentas básicas das tecnoloxías da información e as comunicacións (TIC) necesarias para o exercicio da súa profesión e
	para a aprendizaxe ao longo da súa vida.

To use different computational models and levels of abstraction needed for algorithm design.	A12	B3	
To identify data structures adapted to the studied algorithms to obtain more efficient and robust implementations.	A13	B3	C3

	Contents
Торіс	Sub-topic
Lesson 1. Analysis of Algorithms.	Lesson topics:
Code: T1.	1. Analysis of the efficiency of algorithms: asymptotic notations, computation model,
Outline: This first lesson addresses the analysis of algorithm	empirical verification of the analysis.
complexity as one of the main goals of the course.	2. Calculation of runtimes: analysis of worst and average cases, calculation of O,
The idea is to add algorithmic efficiency to the toolbox of	resolution of recurrence relations.
already familiar criteria like program structure and	
correctness.	
Lesson 2. Data Structures	Lesson topics:
Code: T2.	1. Stacks, queues and lists
Outline: In this lesson, a revision of basic data structures is	2. Trees and heaps
proposed (stacks, lists, queues, trees, sets and graphs) to	3. Hashing
study their usage concerns regarding spatial and temporal	4. Disjoint sets
complexities. Similarly, a deep study is done over interesting	5. Graphs (representation)
structures regarding execution times: hash tables and heaps.	
This last structure will be turned to when dealing with an	
improvement over graph algorithms and in certain dynamic	
programming cases. The complexity of the searching	
operation can be used as a leitmotif in this lesson.	
In the introduction of this lesson, it is important to insist on	
structure criteria of any application designed, motivating the	
use of abstract data structures and its implementation by	
modules. The objective is to establish general outlines of what	
is considered a programming discipline, which must be	
required from the student in the practicals.	
Lesson 3. Algorithms on sequences and sets of data	Lesson topics:
Code: T3.	1. Search algorithms
Outline: The problem of sorting a sequence of elements	2. Sorting algorithms: insertion, Shell, heapsort, mergesort, quicksort
becomes, in this part of the course, an ideal excuse both for	3. Random algorithms
studying the complexity of various kinds of algorithms and to	
present different algorithm design strategies that can be	
extrapolated to solve other problems.	
One of the algorithms that merit special attention is quicksort,	
as it can be used to introduce the fundamental characteristic	
of random algorithms, which can behave in different ways on	
the same input. A direct consequence is that the concepts of	
"best case" or "worst case" for an input	
no longer makes sense, which is an important aspect to	
discuss in class.	

Lesson 4. Greedy algorithms	Lesson topics:
Code: T4.	1. The knapsack problem
Outline: In this lesson, greedy algorithms are studied. Once	2. Graph algorithms: topological sorting, minimum spanning tree and shortest paths
the technique is explained using its general characteristics,	3. Hashing
presented using an example, the most representative	
algorithms of this category will be studied: graph algorithms, a	
solution for the knapsack problem and a planning task	
problem.	
Lesson 5. Algorithm design by induction	Lesson topics:
Code: T5.	1. Divide and conquer
Outline: At this point, the student has already seen various	 Dynamic programming: optimality principle, knapsack problem
algorithms that follow a divide-and-conquer strategy:	,,,,,,
mergesort and quicksort, binary search, maximum	
subsequence sum the work proposed in the first part of this	
lesson consist in generalising the formulation of said strategy,	
identifying its distinct features in each of the proposed	
algorithms.	
The second unit of this lesson concerns the use of a	
bottom-up strategy to find a general solution from the	
solutions to elementary subproblems. From an efficiency	
viewpoint, the use of top-down techniques like "divide	
and conquer" will be questioned in some situations. The	
option of dynamic programming can yield a compromise	
allowing, when possible, an optimization of the amount of	
memory required by the algorithm.	Lesson topics:
Lesson 6. Exploring graphs Code: T6	
	1. Exploring graphs
Outline: The objective of this lesson is to give a broader	2. Strategy games
insight of graph applications to undertake problems of different	S. Dackitacking algorithms
nature, and to take into account algorithmic techniques linked	
to the development of relevant areas of computer science as	
artificial intelligence. The graph algorithms studied in greedy	
algorithms lesson (T4) agree on visiting all the graph nodes.	
The improvement of the execution times of those algorithms	
that avoid the exhaustive visit of the graph nodes will be	
emphasized.	
Lesson 7. Computational complexity	Lesson topics:
Code: T7	1. NP-Completeness, NP-Complete problems
Outline: In this last lesson, we introduce a reasoning about the	
set of algorithms that can solve each kind of problem. We will	
deal with the complexity of problems, lower bounds for	
problem complexity and NP-completeness. In brief, we will	
address the main techniques and concepts used in the study	
of computational complexity.	

Planning

Personalized attention		2	0	2

(*)The information in the planning table is for guidance only and does not take into account the heterogeneity of the students.

	Methodologies				
Methodologies	Description				
Guest lecture /	Lectures where theoretical knowledge is taught using various resources: blackboard, slides, projections, demos and virtual				
keynote speech	resources. They may include guest lectures by invited speakers.				
Short answer	Tests that consist in solving exercises involving the execution of cases using the algorithms studied in the course, or their				
questions	adaptation to other situations. These tests are assessed.				
Laboratory practice	Practicals designed by the professor, based in the knowledge acquired by the student in the keynote speeches, and which				
	therefore complement them.				
	The students will develop this work in groups of two throughout the course, and individually in a final practical that is included in the objective test.				
	The practicals will consist in the implementation of programs that illustrate problems related with the course contents. A report				
	of results will be required for assessment. During the hours assigned to each practical, the reports of the previous practical will be assessed.				
Supervised projects	Supervised projects proposed by the professor and developed by the students, either in groups or individually.				
Problem solving	Examples will be developed on the theoretical contents of each part of the course, and doubts will be solved. The resolution of				
	some of the problems will be assessed individually.				
Objective test	Knowledge of the theoretical and practical contents of the course will be assessed, as well as the final individual practical				
	assignment.				

	Personalized attention					
Methodologies	Description					
Supervised projects	Problem-solving lessons in small groups: Examples about theoretical contents related to the lesson will be developed and					
Laboratory practice	questions will be answered.					
Problem solving						
	Individual or in groups tests for monitoring purposes about the lesson studied. The teacher controls them by SGTs and					
	assessment tests.					
	Computer laboratory practicals: Programs will be implemented to learn problems related to the lesson. A report with results will					
	be asked for assessment.					
	Regarding individual tutoring, it will be maintained during each teacher's office hours through the following channels:					
	- Email, for short answer questions.					
	- Teams: virtual meetings, preferably upon request via email.					

Assessment				
Methodologies	Competencies /	Description	Qualification	
	Results			

	A12 A13 B3	Two objective tests of monitoring assessment, where the theoretical contents skills of	10
questions		the academic work will be evaluated.	
		They will be made during lectures and will be pre-announced in the initial planning	
		presented in the start of the course.	
Objective test	A12 A13 B3 C3	Theoretical and operative knowledge of the subject will be evaluated.	60
		Individual theory over (2h): 400/	
		Individual theory exam (2h): 40%	
		Individual practice exam (2h): 20%	
		To take the first opportunity practice exam, it is mandatory to deliver the laboratory	
		practices in time.	
Laboratory practice	A12 A13 B3 C3	Four laboratory practicals made in pairs, where it will be assessed: program structure,	15
		documentation quality, clarity, appropriateness, and result explanation.	
		To deliver the laboratory practicals in time and form is a necessary condition to take	
		the objective individual practical test for the first opportunity (January).	
		Assessment is done by monitoring practical work, during the laboratory practicals	
		sessions.	
Problem solving	A12 A13 B3	Evaluation of three exercises where, after solving doubts, examples about content	15
		skills of the lesson will be developed.	
		These exercises will be carried out in Small Group Tutorial (SGT) hours scheduled	
		along the course. Sometimes, they may be finished in non-teaching hours.	
Others			

Assessment comments

In the 2nd opportunity, the student may attend again the theory and practice exams (parts planned in the objective test). The individual practical exam (objective test) will take place the same day of the theory exam and different shifts may be established depending on the number of students enrolled; it is mandatory for the student to have in its user account all the practical work done in the course. A student will have a status of ?Absent? if he does not attend the theory and practical exams in the official evaluation period. Part-time enrollment students on this subject, this fact involves that the final grade will be the best one between the one obtained following this teaching guide criteria and the one obtained in the objective test with the following division: 70% theory exam and 30\% practical exam.

In the advanced opportunity of December the total grade (100%) corresponds to a specific exam with theoretical and practical issues.

In the 2nd opportunity, the student may

attend again the theory and practice exams (parts planned in the objective test).

The individual practice exam (objective

test) will take place the same day of the theory exam and different shifts may

be established depending on the number of students enrolled; it is mandatory
